SCOTT & BOWNE, Chemists,
409-415 Pearl Street, New York.
50c and \$1.00; all druggists.

The Bravest Men.
Undoubtedly the bravest class of men that ever trod the earth have been the poets. They could say more fool things about such sentiments as love, and get away with them, than all the rest of mankind would have the courage to stand for in a million years.

The Stradivarius.
Stradivarius violins are extremely rare, and of remarkable excellence in manufacture. Their age and their wonderful mechanical perfection necessarily make them sweeter in tone than less perfect and more modern instruments.

Honeymoons Cut Short.
Brevity and economy in honeymoons, the London Express says, are becoming the fashion. Even wealthy people, it says, are "showing a tendency to limit the wedding tours to three or four days in Paris." Many go straight to their new home from the church and stay there.

Chinese Stamps.
Nearly all Chinese stamps bear dragons, hideous beyond description, as their central figures. Other stamps depict great pagodas and sacred towers, being supposed to guard the "luck" of a place and propitiate the spirits and frighten away the evil ones.

HAMMOCKS.

We have just received a complete assortment of high-grade hammocks of all styles and prices, ranging from \$1.75 to \$7.00

SCREEN DOORS.

A few more screen doors left which will be closed out at a bargain.

AN EXCEPTIONAL BARGAIN.

We offer for a short time best fire-proof safes at a great saving. It will pay you to investigate these bargains.

CARE OF BABY CHICKS.

Handy Coop Arrangement For Hens and Their Broods.

The following is the care given a hen and her chicks by a successful poultry keeper: "My little 'sitting' house has nests for sixteen hens, and I try to set as many at a time as I can. When the chicks are hatched I take them out of the nests and put them in a big market basket with a warm woolen cloth to cover them. Then selecting the hens that seem the most anxious about their chicks I put the hens in little 'A' coops, made with the slats perpendicular, the back boarded up, the upper half of back hinged to lower half and held in place by button at top. Made in this way the hen can be got at easily or a dead chick taken out of the coop without difficulty, and on a cold,

HANDY HENCOOP.
[Fig. 1, unfinished coop; Fig. 2, coop completed.]

windy day the wind does not sweep through the coop, chilling the chickens, as it does when both ends of the coop are slatted.

"I place two of these coops about ten feet apart and connect them by two frames, one covered with inch mesh wire netting for front and back frame covered with half inch matched boards, with a door at each end, so as to get at the front of the coops with feed and water. As the top part of the front frame is made of a board a foot wide, thus more than half of the runway is kept dry, and the chicks can run around on a rainy day without getting wet and are safe from hawks and 'varmints.' As these frames are only fastened to the coops by a nail or screw, they can be taken off and stored away in a shed in the fall. When chicks are hatched in cold weather I put only fifteen with each hen. In May or the last of April I put twenty to twenty-five with each hen.

"As the chicks are all the same color and age, the hens do not know their own chicks and will take any of them. The chicks remain with the hen as long as she will mother them."—Business Hen.

AERATION OF MILK.

Pretty Bad to Perform This Operation in the Barnyard.

By aeration of milk we understand the exposing of milk to air, of the forcing of air into milk. The theory of the practice is that the oxygen of the air purifies or improves the milk, and at the same time gases or volatile oils which are in the milk are enabled to pass away. It is true that if the air to which the milk is exposed or which is forced into the milk is perfectly pure the result undoubtedly is an improvement in the flavor and physical quality of the milk, but in many cases the air is not pure, and very often as much harm as good is done, says Professor H. H. Dean of Canada in American Agriculturist.

The Benefit of Aeration.

Now, to my mind for a man to aerate milk in a barnyard is one of the worst things he could possibly do. I speak from experience. We have milked our cows in the yard, which, I think, is kept a good deal cleaner than the average barnyard. We have put the aerator over the fence, milked the cows and have let the milk run down over the aerator. The result was that we got some of the worst milk we could possibly have.

Unless the air is pure I think it would be best to cool the milk with as little aeration as possible. The chief benefit from aeration, to my mind, is the opportunity that is given for any bad flavors arising from undesirable feed or indigestion on the part of the cow to pass away. There is also a certain amount of cooling which is advantageous.

Open Lot Steer Feeding.

The Pennsylvania experiment station reports another experiment in feeding cattle in barn and in lot with access to open shed, with the same general results as heretofore. It "shows that the gains made by fattening steers are not increased by warm quarters. It is not possible to have steers too cold for fattening steers in this climate, provided they are kept dry and well bedded," which is the experience of commercial cattle feeders. Nor in this instance were gains made cheaper indoors than in the lot, the outdoor steers eating less per pound of grain than the others. The table of gains does not suggest that the steers were on full feed, the daily gain being 14 pounds per day for a period of 125 days. It seems safe to assert that steers on full feed require no stabling and that steers being fed so that they are putting on flesh are not in need of heat either.—National Stockman.

Club Root in Turnips.

Based upon English experiments carried on for a number of years is the suggestion that two and one-half tons of common lime slaked to a fine powder and applied to an acre of infested soil will usually result in securing a crop reasonably free from this disease. It is noted that the effect of the lime may be more apparent on the second than on the first crop which follows its application.

Improving on Tennyson.

"Bills to the right of us, bills to the left of us, bills that are ruinous!" papa dear taunted. "Frightful the charge was made! Senseless the price you paid!" Then on the table laid check for six hundred.—Lowell (Mass.) Citizen.

Cross Breeding of Plants.

It is only within a century that hybridization or the cross breeding of plants has been practiced. Yet it seems to have been in Lord Bacon's mind, as a thing to be achieved, more than 30 years before.

Smelling Competition.

At a recent smelling competition in London only 6.72 per cent of the competitors succeeded in distinguishing the odors of common oils. Those most easily identified were camphor, peppermint, vanilla and cloves; those least recognized were hemlock and lavender.

Wild Animals Dying Out.

Few wild animals are left in New Zealand. The government takes good care of the remnant, and seeks to add new varieties. Among recent importations are chamois from the Austrian Alps, which ought to flourish in the mountains of New Zealand.

Strength of Wire Rope.

Tests of the strength of wire rope conducted for the French government, show that the ultimate strength of a round rope is 33 per cent less than the sum of the tensile strengths of its individual wires before being laid.

Stone in Bridges.

In this age of steel stone has by no means been put out of use in building important viaducts and bridges. The second largest stone arch bridge in the world was recently completed at Salcano, Austria. Its span is 279 feet.

At Last, a Perfect Visible Typewriter

All of the writing VISIBLE all of the time—not a half-visible typewriter. Light, quick touch; either two colors or single color ribbon; interchangeable carriage; regular and speed escapement; automatic line spacing; a perfect line lock, and various other USEFUL features, making the FOX VISIBLE beyond doubt the best typewriter on the market. We put them in on TEN DAYS' FREE TRIAL.

Weight of Ocean Cables.

In Cyrus Field's original cable the weight of the ocean section was a ton for every nautical mile, 167 pounds being the weight of the copper conducting wire, the remainder being the weight of the insulating material and protecting sheaths of laid iron wire. The French cable of 1898, typical of the modern cables, has a weight of 661 pounds of copper conductors and 400 pounds of gutta percha insulating material to the nautical mile.

Flow of Rivers.

The flow of rivers, as might be supposed, is the slowest at the bottom of the water and highest at the top. The average velocity of the entire stream is found, as a rule, at about six-tenths of the depth. The friction of the bottom which retards the movement of the deepest water is much greater, relatively to the whole volume of the stream, in a shallow river than in a deep one.

Steadying the Mind.

The mind of most of us wants steadying many times a day. It is like a compass on a rickety table: the least stir makes the needle swing round and point wrongly. But give it a moment to settle—then it points true. There is almost divine virtue in silence. Drop the thing that worries you, the annoyance which inflames your temper.

Steam in Its Infancy.

The first steamer to make a voyage across the western ocean was the Savannah of 350 tons and a length of 100 feet. She sailed from Savannah, May 24, 1819, and arrived at Liverpool June 20. Her steam was purely auxiliary, for when the wind was fair or the sea high the paddle wheels were unshipped and stowed on deck.
